AGENT DEVELOPMENT ENVIRONMENT

Your agent fleet. One flight deck.

A native desktop environment that orchestrates fleets of AI coding agents — PTY-backed CLIs and API agents side by side — with mission-style work orchestration, remote workspaces, shared tooling, and full cost visibility.

ONE WORKSPACE, EVERY AGENT

01

Claude Code, Codex, and OpenCode CLIs run in native terminal panes beside streaming API agents — eight providers, one workspace, one event contract.

FLIGHTS ORCHESTRATION

02

Organize work into Flights above issues and sessions. Launch parallel attempts — one isolated git worktree per agent — compare results, publish the winner.

SSH REMOTE WORKSPACES

03

Pin a host and work there: remote terminals, remote worktrees, agent file and shell tools over SSH with host-key pinning and keyring-held credentials.

MCP HUB

04

Manage Model Context Protocol clients and servers in one place, and wire the same tool sources into any agent — local or remote.

PROJECT MEMORY

05

A persistent memory layer keeps agents grounded in project context, so every session starts with what the last one learned.

COST ANALYTICS

06

Token and cost rollups across providers, sessions, and Flights — see exactly what each attempt costs before you scale the fleet.
